Designers & Manufacturers of Prefabricated Stadium Seating Solutions

Stadium Seating

Enterprises, Inc.

SSE Stadium Seating Solutions offer the advantages of design simplicity, ease of installation and flexibility to fit any auditorium configuration, and/or floor slope.

SSE Solutions are based on a building module small enough to be brought into the auditorium through a standard pedestrian door. The system is installed late in the construction sequence allowing the general contractor the flexibility and efficiency to complete all the "high-work" without scaffolding over the stadium seating platforms. Additionally, SSE Systems can be designed to accommodate storage, concessions, restrooms or offices under the stadium platform.

The platform module is typically produced from EPS blocks custom manufactured for use in stadium seating platforms. The module typically equals the depth of the platform x the height of the risers x 96" however, because it is easily molded and/or cut into any shape or dimension, SSE-EPS Foam can easily be field-cut to accommodate any auditorium seating configuration. That flexibility allows maximum design creativity for

auditorium layout without the additional cost typically associated with the fabrication of custom shapes to accommodate unique layout conditions.

Easily installed by the local general contractor, EPS Foam blocks are secured to the floor slab by means of a special adhesive. Then, in turn, SSE-EPS Foam blocks are stacked and attached to each other in the same manner with a small amount of adhesive. The SSE System solution is completed by the addition of prefabricated 16 gauge steel shapes for the riser plates, intermediate steps and connecting hardware.

Because of the inherent system flexibility, cost effectiveness and ease of installation, SSE Customers have found the SSE Solution to consistently be more desirable than any other systems on the market.
